

IN THE CLAIMS:

1. (Currently Amended) A method in a data processing system for managing a document, the method comprising:
responsive to a printer being unavailable, receiving a first request from a user at a remote data processing system to save a document for printing, wherein the request includes the document;
storing a record of the document in a repository in association with the user in response to receiving the request to form a stored document; and
sending the stored document to [[a]] the printer in response to a signal receiving a second request from the user to print the stored document to the printer.
2. (Original) The method of claim 1, wherein the printer is located at one of the remote data processing system or the data processing system.
3. (Currently Amended) The method of claim 1, wherein the step of storing the record of the document comprises:
storing a pointer to the document.
4. (Currently Amended) The method of claim 1, wherein the record comprises an entire document ~~pointer is one of a path or a universal resource locator.~~
5. (Currently Amended) The method of claim [[2]] 3, wherein the step of sending the document comprises:
retrieving the document using the pointer to form a retrieved document; and
sending the retrieved document to the printer.
6. (Original) The method of claim 1 further comprising:
responsive to a request from the user to access the repository, sending an identification of all documents associated with the user to the user at the remote data processing system.

7. (Currently Amended) A method in a data processing system for managing printing of a document, the method comprising:
responsive to a manipulation of a selected graphical indicator by a user when a specified printer is unavailable, saving a record of a document associated with the graphical indicator in a repository for printing at a later time; and
responsive to a request from the user to print the document stored in the repository, sending the request to the repository, wherein the document is retrieved from the record of the document and [[is]] sent to a printer for printing.
8. (Original) The method of claim 7 further comprising:
requesting an identification of documents in the repository in response to a request for access to the repository; and
displaying documents stored in the repository in response to receiving the identification.
9. (Currently Amended) The method of claim 7, wherein the repository is a print queue that holds documents for a plurality of different users.
10. (Currently Amended) The method of claim 7, wherein the specified printer and the printer are a same printing machine. ~~printer is located at the repository.~~
11. (Currently Amended) The method of claim 7, ~~wherein the specified printer is a color printer connected to the user by a network. printer is located at another data processing system.~~
12. (Currently Amended) The method of claim 8, wherein the request [[to]] for access to the repository document is generated by a second manipulation of the graphical indicator.
13. (Original) The method of claim 7, wherein the sending step and the saving step are performed by a print plug-in.

14. (Cancelled)

15. (Currently Amended) A data processing system comprising:

a bus system;

a communications unit connected to the bus system;

a memory connected to the bus system, wherein the memory includes a set of instructions; and

a processing unit connected to the bus system, wherein the processing unit executes the set of instructions to save a record of a document associated with the graphical indicator in a repository for printing at a later time in response to a manipulation of a selected graphical indicator when a printer is unavailable; and send the request to the repository in which the document is sent to the printer for printing in response to a request to print the document stored in the repository.

16. (Currently Amended) A data processing system for managing a document, the data processing system comprising:

receiving means for receiving a request from a user at a remote data processing system to save a document for printing when a printer is unavailable, wherein the request includes the document;

storing means for storing a record of the document in a repository in association with the user in response to receiving the request to form a stored document; and

sending means for sending the stored document to [[a]] the printer in response to a signal.

17. (Original) The data processing system of claim 16, wherein the printer is located at one of the remote data processing system or the data processing system.

18. (Currently Amended) The data processing system of claim 16, wherein the ~~storing means comprises:~~

~~means for storing the record of the document is a pointer to the document.~~

19. (Original) The data processing system of claim 16, wherein the pointer is one of a path or a universal resource locator.

20. (Original) The data processing system of claim 17, wherein the sending means comprises:

retrieving means for retrieving the document using the pointer to form a retrieved document; and

sending means for sending the retrieved document to the printer.

21. (Original) The data processing system of claim 16, wherein the sending means is a first sending means and further comprising:

second sending means, responsive to a request from the user to access the repository, for sending an identification of all documents associated with the user to the user at the remote data processing system.

22. (Currently Amended) A data processing system for managing printing of a document, the data processing system comprising:

saving means, responsive to a manipulation of a selected graphical indicator, for saving a record of a document associated with the graphical indicator in a repository for printing at a later time as a result of a given printer being unavailable; and

sending means, responsive to a request to print the document stored in the repository, for sending the request to the repository, wherein the document is sent to ~~[[a]]~~ the given printer for printing.

23. (Original) The data processing system of claim 22 further comprising:

requesting means for requesting an identification of documents in the repository in response to a request for access to the repository; and

displaying means for displaying documents stored in the repository in response to receiving the identification.

24. (Original) The data processing system of claim 22, wherein the repository holds documents for a plurality of different users.

25. (Currently Amended) The data processing system of claim 22, wherein the printer is located at one of the repository or another data processing system.

26. (Cancelled)

27. (Original) The data processing system of claim 23, wherein the request to access the document is generated by a second manipulation of the graphical indicator.

28. (Original) The data processing system of claim 22, wherein the sending means and the saving means are located in a print plug-in.

29. (Currently Amended) A computer program product in a computer readable medium for managing a document, the computer program product comprising:
first instructions for receiving a request from a user at a remote data processing system to save a document for printing when a printer is unavailable, wherein the request includes the document;

second instructions for storing the document in a repository in association with the user in response to receiving the request to form a stored document; and

third instructions for sending the stored document to ~~[[a]]~~ the printer in response to a signal.

30. (Currently Amended) A computer program product in a computer readable medium for managing printing of a document, the computer program product comprising:

first instructions, responsive to a manipulation of a selected graphical indicator when a printing machine is unavailable, for saving a document associated with the graphical indicator in a repository for printing at a later time; and

second instructions, responsive to a request to print the document stored in the repository, for sending the request to the repository, wherein the document is sent to a ~~printer~~ the printing machine for printing.

31. (New) A method in a data processing system for managing a document, the method comprising:

receiving a first request from a user at a remote data processing system to save a document for printing, wherein the request includes the document;

storing a record of the document in a repository in association with the user in response to receiving the request to form a stored document; and

sending the stored document to a given printing machine in response to receiving a second request from the user to print the stored document at the given printing machine.

32. (New) The method of claim 31, wherein the repository is a print queue.
